

Standing Out in the World of Retail Banking

Big Data, New Trends, Better Experiences

The retail banking industry is seeing a major shift, moving toward more digital interactions, increased data flows, and new competition. Changes in consumer behavior, expectations, and technological developments are all creating new demands.

Consumers now expect traditional services (savings and checking accounts, mortgages, personal loans, and debit/

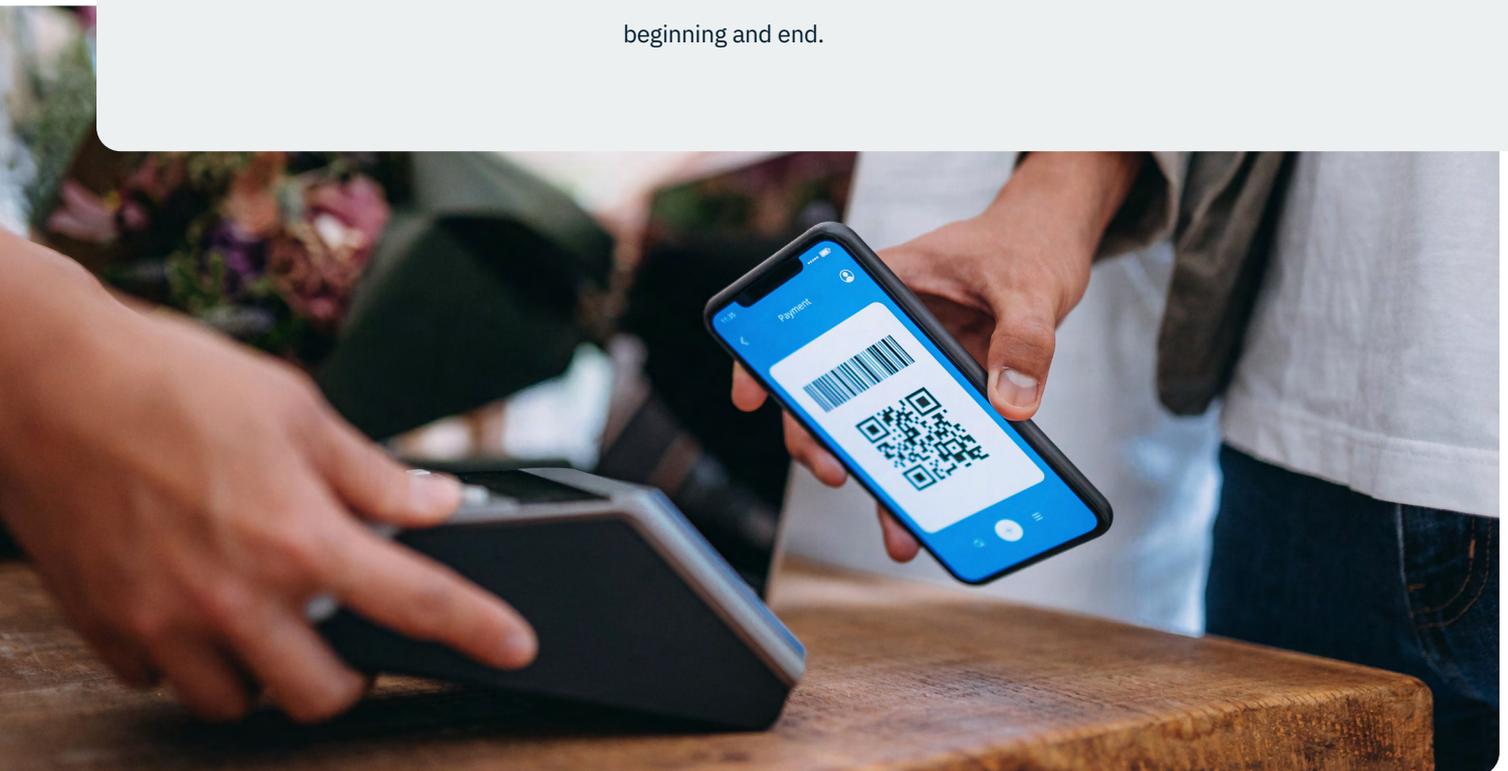

credit cards) to be completely reinvented. They want to open accounts in seconds, have a mortgage in minutes, and access all their banking data in just one click.

At the same time, we are seeing an increase in digital payments, rising regulatory pressures, and more competition from disruptive challenger brands outside of the traditional banking sector.

The banking world is now faced with many changes and challenges, but there is a solution: Data.

In this paper, we explore how retail banks can use all types of customer data to their advantage by:

- Capturing meaningful data to understand customer decision making.
- Combining data from multiple sources to explore opportunities to increase value.
- Analyzing consumer behaviors and emotions to understand relationships and uncovering the moments that matter most in customers' experiences.
- Creating connected omnichannel experiences to create holistic multichannel experiences.
- Collecting data accurately across the whole customer journey, not just the beginning and end.

Customers Expect Action in Exchange for Their Data.

It's Time to Deliver!

Yes, collecting data has huge benefits for how you run your business and create efficient organizational change, but more importantly, collecting customer data needs to benefit your customers. They need to feel listened to and like their feedback inspires change that positively impacts their banking experience.

Companies who adopt data-driven marketing are more likely to have an advantage over the competition and increase profitability. In fact, they are **six times** more likely to be profitable year-over-year. (Forbes)

When you take a strategic approach in how you take action on data, you will start to recognize the following benefits:

- Positive culture changes within your organization
- Relevant real-time data
- Ability to create strategic action plans
- Alignment on a clear experience vision
- Agility necessary to keep up with trends and competitors

- Happier customers and employees
- Increased return on investment, in both the short term and the long run

And if you needed more convincing as to why data intelligence is so important, today's retail banks are competing not only with challengers and fintechs, but also with tech giants who are successfully breaking into the banking sector. These companies are the original pioneers of data driven decision making and have a wealth of data about their customers.

It's time to get competitive!

Your Customers Are Making a Mountain of Data—Conquer It!

A vast amount of data is generated about your customers across numerous touchpoints on a daily basis. The question is, how do you aggregate that data and apply it to key initiatives for measurable impact?

A report from McKinsey & Company shows that between March and August 2020, one in five consumers switched brands, and seven in ten tried new digital channels. But the resulting surge in data has not provided marketers with substantially better understanding of their customers, because their companies' outdated data modelling isn't able to capture these shifts with the necessary granularity and speed.

Data that is available at the right time can help you understand customer behavior, adapt to their needs, and even predict future behaviors quickly. However, you first need to ensure that the data

you are analyzing is centralized and validated in one platform in order to make informed business decisions and future proof experiences.

5 Strategies for Retail Banks Looking to Leverage Big Data

Now that you understand the importance of leveraging the data at your disposal, here are some key topics to consider when collecting and analyzing data, to ensure that what you are receiving is relevant, meaningful, and actionable.

#1: Capture Meaningful Data

Retail banks have included customer experience improvement goals in their strategic plans for years now, but they still struggle with multichannel customer engagement because data silos and manual processes cause poor and disjointed experiences.

Listening to customers is one of the best ways for banks to gather rich data about the experiences they provide. However, in order to listen meaningfully, the survey design must reflect what your business is trying to achieve and what KPIs have been set. Designing listening strategies with the end in mind is the premise for a holistic program. When you know what data you want to collect, you can make sure you are asking the right questions at the right touchpoints.

Banks have a vast amount of data on customers—including credit card transactions, payments, deposits and withdrawals, and adoption of products and services. Not only can banks leverage non-banking information around customer behaviors and spending habits. They can also leverage a mix of unstructured and structured feedback data along different customer journey points, as well as unsolicited feedback from social media platforms and review sites to piece together a more holistic view of their customers.

Bank customers want intelligent interactions, which are contextual and must be personalized to their needs. By understanding your customers' needs, you are able to make recommendations, personalize your services, and predict future behavior.

#2: Combine Data from Multiple Sources

Breaking down data silos and combining data from multiple sources across an organization can increase efficiency and control in a fast-changing and demanding environment.

Without connecting the data streams from different lines of business, products, and services, all in one centralized platform, banks risk a distorted view of the customer experience as well as a poor and disjointed omnichannel experience—and ultimately an increase in customer churn.

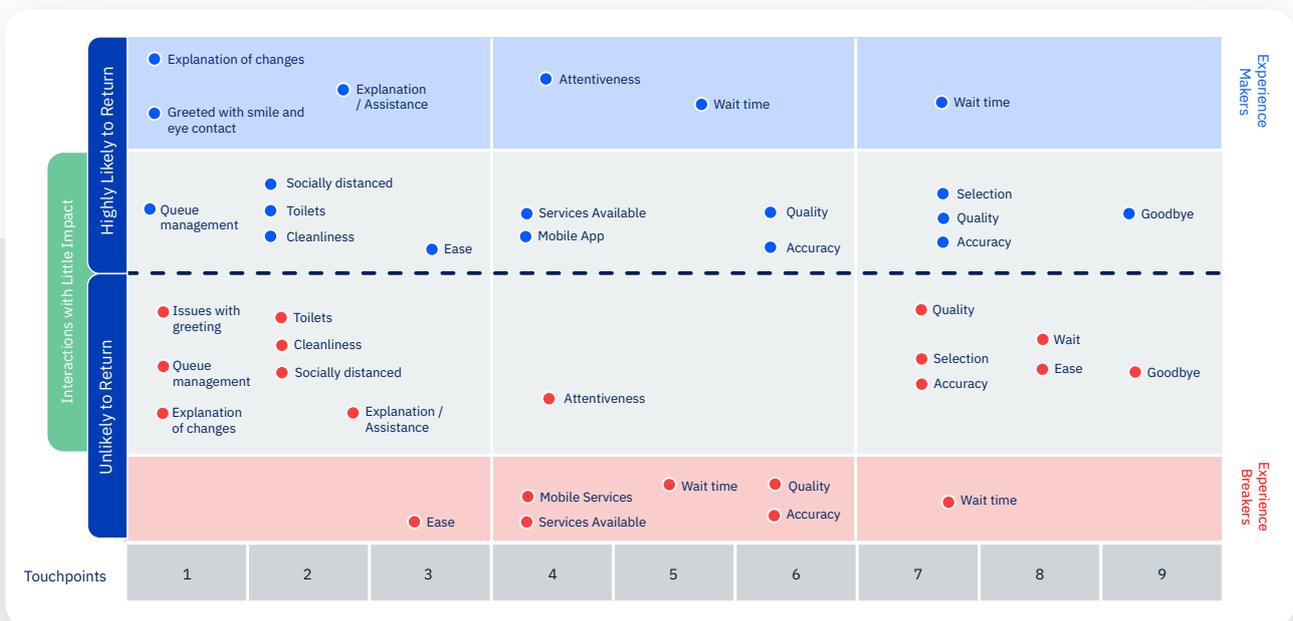

Customer insights provide deep knowledge about customers to optimize each interaction with the customer. Having a 360-degree view of all facets of a customer's activity and engagement with your bank would enable a holistic approach. By eliminating silos, banks

can consolidate individual customer data across business lines. A real-time single customer view across the customer journey improves data analytics and, as a result, firms can spot upsell and cross-selling opportunities.

#3: Analyze Behavior and Emotions

Customer journeys are multidimensional and influenced by many emotional behaviors. Without creating positive emotions in customers, banks run the risk of becoming nonessential to their customers. Knowing where and when to focus is key to making the greatest impact—and to keeping customers coming back again and again.

Designing experiences to create emotional connections with customers at the key touchpoints increases value and reduces risk. **Here is an example of how InMoment banking client, Virgin Money, is putting its money where its mouth is by doing just that:**

Client Spotlight: Virgin Money

CUSTOMERS THAT SMILE, STAY

Virgin Money is a big advocate for utilizing behavioral science practices to better understand customer emotions and impressions. The Virgin Money team wanted to delve deeper into their customer data to see the customer journey from the customer’s perspective and help the team to understand where they were succeeding and where they needed to improve.

InMoment helped pinpoint areas for improvement through Touchpoint Impact Mapping, which uses unstructured customer data to detect the moments of emotional highs and lows that most impact customer experiences.

Through Touchpoint Journey Mapping, Virgin Money uncovered that negative emotions in the onboarding experience could impact future experiences and, therefore, action needed to be taken in this area to overcome friction.

Retail banks need to take advantage of the latest techniques in data science to explore their wealth of data in detail, including structured, unstructured, and inferred. Having all this information at their fingertips means banks are able to deliver fresh insights across the organization in a way that encourages the right transformative actions to be taken with clarity.

#4: Master Omnichannel Experiences

Customers today are seeking out consistent and relevant omnichannel experiences, with 70% stating that it's vital to their selection of a bank of choice.

Customers demand intuitive, integrated omnichannel experiences that are personalized, on-demand, and accessible anywhere, 24/7. However, cross-channel friction still frustrates customers despite

banks' efforts to deliver an omnichannel experience, and thus, the gap between customer expectations and retail banks' priorities continues to grow further apart.

A study from Boston Consulting Group shows that online banking use has risen by 23%, and mobile banking use is up by 30%. This cements the fact that the retail banking customer journey is changing and becoming more multichannel and cross functional.

However, customers expect the same on-hand, expert help online that they would receive in-store. They also expect the experience to be consistent, no matter what part of the bank they are interacting with.

#5: Collect Data Across the Entire Customer Journey

Retail banks can achieve their goals by identifying value opportunities within their customer journey. The typical bank has touchpoints such as joining the bank, borrowing, saving, and making transactions. By identifying and prioritizing these interactions and focusing on what matters most to your customers, retail banks can achieve business growth.

Banks must keep the customers at the heart of the journey by tracking key moments in their experiences and measuring sentiment through data and text analytics to see which key areas are having the most impact on their decision making in order to strengthen and improve these specific moments in the journey.

Client Spotlight: NatWest

Natwest wanted to gather data from customers using different products at every stage of their respective customer journey.

Using the InMoment platform, the data that Natwest receives throughout different stages within the customer journey is collated and analyzed at every level in the organization to ensure the business is working together with a holistic approach instead of in silos. Every week, individual branch and telephone teams review the data and the interactions they have with customers. Regions then get together once per month to share best practices across the group.

The central insight teams utilize all data points from customer insight and NatWest's internal customer information to allow them to focus on how to improve customer experiences across different customer journeys.

"By using customer feedback to uncover customer stories and unlock value in customer data, NatWest is able to create more engaging, meaningful, and relevant customer experiences."

ANTHONY BROWN,
CUSTOMER INSIGHT RELEASE TRAIN LEAD, NATWEST

Ultimately, your CX data should be set up in a way that enables you to solve business problems and make decisions with your customer and employee perspective in mind. By optimizing your data collection process and making relevant data accessible to the right internal teams, you will drive experience outcomes and achieve your business goals.
